This makes the secreted heat shock protein more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and infectious diseases, allergy or autoimmune diseases. The present sequence encodes KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain of human cartilage oligomeric matrix protein (COMP) pentamerisation domain, a camel IGG oligomeric matrix protein (COMP) pentamerisation domain, a camel IGG clinker domain and the carboxy-terminal sequence KDEL. The subsequence disculphide bonds.
                                                                                                                                                                                                                                                                                                                                                                                                         Matches

                               The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and astromytoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The patent discloses the use of KDEL receptor inhibitor to promote CC secretion of proteins that are normally retained within the cell such as CC heat shock proteins by inhibiting KDEL receptor-mediated return of CC protein complexes to endoplasmic reticulum. This makes the secreted heat Shock proteins more accessible to the immune system and improves immune CC response to a target antigen. The inhibitor protein comprises several CC subunits where each subunit comprises an oligomerisation domain and has CC at its carboxy terminus a region which binds to a KDEL receptor. The CC target antigen may be associated with diseases including neoplasia such CC as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and CC astromytoma, with defective tumour suppressor genes, oncogenes, CI infectious diseases, allergy or autoimmune diseases. The present CC sequence encodes KDEL receptor inhibitor comprising regions encoding a CC cleavable signal peptide; the oligomerisation domain of human CC thrombospondin 3 (TSP3) trimerisation domain; a camel 1gG linker domain CC and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat cartilage oligomeric matrix protein which provides concerns of the carboxy-terminal sequence KDEL.

The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins by inhibiting KDEL receptor-mediated return of the heat shock proteins by inhibiting KDEL receptor-mediated return of the protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune thought to a target antigen. The inhibitor protein comprises several comprises to a target antigen. The inhibitor protein comprises several cat its carboxy terminus a region which binds to a KDEL receptor. The carrier antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and serromytoma, with defective tumour suppressor genes, oncogenes, cinfectious diseases, allergy or autoimmune diseases. The present sequence encodes KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain of Xenopus thrombospondin 4 (7594) trimerisation domain including an additional
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Chimeric
Chimeric
sub-sequence; a camel IgG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat cartilage oligomeric matrix protein which provides increased stability via disulphide bonds.
                                                                                                                                                                                                                                                              Disclosure; Fig 5; 87pp; English

The present sequence encodes KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain of mouse thrombospondin 3 (TSP3) trimerisation domain including an additional sub-sequence; a camel IgG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat cartilage oligometric matrix protein which provides increased stability via disulphide bonds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as according a lymphoma lenkemia molaroma carriers and shalaroma and second as the second of th
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 369

                                                                                                                                                                   infectious diseases, allergy or autoimmune diseases. The present sequence encodes KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain from rat cartilage oligomeric matrix protein, a camel IgG linker domain and the carboxy -terminal sequence KDEL. This is introduced into host cells by suitable
                                                                                                                                                                                                                                                                                      shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sercoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and asstromytoma, with defective tumour suppressor genes, oncogenes,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Inhibitors of the KDEL receptor which comprises an oligomerization domain useful for promoting secretion of proteins which are normally retained within the cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CDS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    KDEL receptor inhibitor; heat shock protein; immune respondigomerisation domain; neoplasia; sarcoma; lymphoma; leumelanoma; carcinoma; gliobhastoma; astromytoma; oncogene; infectious disease; allergy; autoimmune disease; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat

The present sequence encodes KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain from rat cartilage oligomeric matrix protein (COMP); a camel IgG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat COMP which provides increased stability via disulphide bonds. This is introduced into host cells by suitable vectors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprise an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and

                                                                                                                                                       as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and astromytoma, with defective tunour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present sequence encodes KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; a myc-tag; an N-glycosylation sequence; the oligomerisation domain of rat cartilage oligomeric matrix protein (COMP); a camel IGG linker domain and the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat COMP which provides increased stability via disulphide bonds.
                                                                                                                                                                                                                                                                                                                                                                                               shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The patent discloses the use of KDEL receptor inhibitor to promote secretion of proteins that are normally retained within the cell such as the heat shock proteins by inhibiting KDEL receptor-mediated return of protein complexes to endoplasmic reticulum. This makes the secreted heat shock proteins more accessible to the immune system and improves immune response to a target antigen. The inhibitor protein comprises several subunits where each subunit comprises an oligomerisation domain and has at its carboxy terminus a region which binds to a KDEL receptor. The target antigen may be associated with diseases including neoplasia such as sarcoma, lymphoma, leukemia, melanoma, carcinoma, glioblastoma and astromytoma, with defective tumour suppressor genes, oncogenes, infectious diseases, allergy or autoimmune diseases. The present sequence encodes KDEL receptor inhibitor comprising regions encoding a cleavable signal peptide; the oligomerisation domain of mouse thrombospondin 3 (TSP3) trimerisation domain; a camel IGG linker domain cand the carboxy-terminal sequence KDEL. The subsequence GDCC is an alteration of rat cartilage oligomeric matrix protein which provides increased stability via disulphide bonds.

                                                                                                                                                             S
                                                                                                                                                                                                                                                                New nucleic acids are described which encode a protein comprising the second and third type 1 repeats of human TSP (thrombospondin)-1, but not the TGF (transforming growth factor)-beta activation region of human TSP-1. The nucleic acid of TSP (thrombospondin)-1 containing the second and third type-1 repeats and the COMP (cartilage oligomeric matrix protein) assembly sequence (COMP/TSP-1) was produced by PCR (polymerase chain reaction). Expression of COMP/TSP-1 caused inhibition of the growth of tumours in mice models. Thus the nucleic acids and proteins may be useful for treating angiogenesis related diseases such as cancer (by reducing the rate of growth and size of tumours), arthritis, psoriasis, diabetic retinopathy, corneal graft rejection, and glaucoma. They may also be used for treating human immunodeficiency virus (HIV) infection. Anti-angiogenic therapy has little toxicity, does not require the therapeutic agent to enter tumour cells or cross the blood-brain barrier, controls tumour growth independently of growth of tumour cell heterogeneity, and does not induce drug resistance.

                                                                                                                                                                                                                                                      angiogenesis related diseases such as cancer (by reducing the rate of growth and size of tumours), arthritis, psoriasis, diabetic retinopathy, corneal graft rejection, and glaucoma. They may also be used for treating human immunodeficiency virus (HIV) infection.

Anti-angiogenic therapy has little toxicity, does not require the therapeutic agent to enter tumour cells or cross the blood-brain barrier, controls tumour growth independently of growth of tumour cell heterogeneity, and does not induce drug resistance.
                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acids are described which encode a protein comprising the second and third type 1 repeats of human TSP (thrombospondin)-1, but not the TGF (transforming growth factor)-beta activation region of human TSP-1. The nucleic acid of TSP (thrombospondin)-1 containing the second and third type-1 repeats and the COMP (cartilage oligomeric matrix protein) assembly sequence (COMP/TSP-1) was produced by PCR (polymerase chain reaction). Expression of COMP/TSP-1 caused inhibition of the growth of tumours in mice models. Thus the nucleic acids and proteins may be useful for treating the produced by the content of the growth of tumours in mice models.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding chimeric proteins such as cartilage oligomeric matrix protein (COMP)/thrombospondins (TSP)-1 and 2, useful for inhibiting angiogenesis and treating diseases such as cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                CDS

                                                                                                                                                                                                                                                                      The present invention relates to methods of diagnosing breast cancer in a patient, which comprise detecting the level of expression in a tissue sample of two or more genes selected from those shown in ABT09867-ABT11112, where a differential expression of the genes indicates breast cancer. The methods are useful in diagnosing, treating, detecting the progression, and in monitoring treatment of breast cancer in patients. The methods are also useful as a screening tool for agents that modulate the onset or progression of breast cancer. The breast cancer genes may be used as diagnostic markers for the prediction or identification of the malignant state of breast tissue, for confirming the type and progression of cancer, and for drug screening and assays. The present sequence is a coding sequence of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Diagnosing breast cancer in a patient comprises detecting the level of gene expression in cell or tissue samples, where a differential gene expression is indicative of breast cancer -

                                                                                                        Ş
                                                                                                                                                                                                                                                                                                                                        The invention comprises a method of detecting a breast cancer-associated CC transcript in a cell from a patient. The method of the invention involves contacting a biological sample from the patient with a nucleotide that the principle of the invention involves CC contacting a biological sample from the patient with a nucleotide that the principle of the form the patient with a nucleotide that cCC in the specification. The method of the invention is useful in the CC diagnosis or prognosis of breast cancer, and for detecting genes that are up or down-regulated in breast cancer cells. Genes identified by the CC targets for screening for therapeutic compounds that modulate breast cancer (e.g. hormones or antibodies). Identification of genes that are cover or under expressed in breast cancer can additionally provide high-resolution, high-sensitivity datasets which can be used in the areas of diagnostics, therapeutics drug development, pharmacogenetics, protein structure and biosensor development. DNA sequences ABT07693 - ABT07761 represent the 69 breast cancer-associated gene sequences of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    cc anti-neoplastic agent. The method involves exposing cells to a chemical cagent to be tested for anti-neoplastic activity, determining a change in cexpression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL6164 cc ABL70110), or is at least 95% identical to (S), where a change in cexpression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening cc an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a cresult of MI, and the data is sufficient to convey the chemical cc treatment of cancer such as colon, breast, stomach, lung, thyroid, cossphageal, ovarian, kidney, prosetate or pancreatic cancer, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, cifiltrating lobular cancer, squamous cell carcinoma, neuroendocrine cc carcinoma, papillary carcinoma and Wilm's tumour.

The present invention describes a method (M1) for screening for an CC anti-neoplastic agent. The method involves exposing cells to a chemical CC agent to be tested for anti-neoplastic activity, determining a change in CC expression of at least one gene (I) of a signature gene set, where (I) CC comprises a sequence (S) selected from 8447 sequences (given in ABL61664 CC to ABL70110), or is at least 95% identical to (S), where a change in CC expression is indicative of anti-neoplastic activity. (I) has cytostatic CC activity and can be used in gene therapy. M1 can be used for screening CC an anti-neoplastic agent, and can be used for producing a product which CC is the data collected with respect to the anti-neoplastic agent as a CC result of M1, and the data is sufficient to convey the chemical CC structure and/or properties of the agent. M1 can be used in the CC treatment of cancer such as colon, breast, stomach, lung, thyroid, CC adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating ductal cancer,
                                                                                                                                                                                                                                                                                                                                                                                                                          29-SEP-2000;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
